Space Weather Forecast

Issued on Monday, 05 September 2022 at 00:16 Local

This forecast provides a four day assessment of space weather events. The probabilities stated below are for reaching or exceeding the given levels. For more information about space weather impacts please see the Met Office Space Weather Scales https://www.metoffice.gov.uk/weather/learn-about/space-weather/uk-scales

---

Space Weather Forecast Headline: Chance of R1/R2 Radio Blackouts. G1/G2 Minor/Moderate Geomagnetic Storm expected day 1 (5th).

Analysis of Space Weather Activity over past 24 hours

Solar Activity: Solar activity has been Low, with periods of common class flares throughout. There are currently five sunspot regions on the visible disc. AR3089 remains the largest and most complex region, which is now approaching the southwest limb. This region has lost its delta configuration. All other remaining sunspots are relatively small and simple, with no signs of growth or activity. No Earth-directed CMEs (Coronal Mass Ejections) were observed.

Solar Wind / Geomagnetic Activity: The solar wind was indicative of a transition from one high speed stream into another stronger high speed stream. The solar wind increased from elevated to strong levels during the 4th September. Total interplanetary magnetic field strength was mostly moderate. The all important north-south component was mostly negative, with sustained periods of moderate to weak negative Bz during the 4th. Geomagnetic activity was stormy on September 4th, with intervals of successive G1/Minor, G2/Moderate and G3/Strong storms (Kp5, 6 and 7 respectively) were observed using BGS data.

Energetic Particles / Solar Radiation: The count rate of energetic particles (high energy protons) is at background levels, with no solar radiation storms occurring.

Four-Day Space Weather Forecast Summary

Solar Activity: Solar activity is expected to remain largely Low, with an ongoing chance of Moderate flares, mostly from AR3089. This spot will likely exert influence on the flare risk due to it's location until the end of day 3 (7th). A new region may rotate onto the northeast limb on day 1 (5th), potentially increasing the probabilities of significant flares.

Solar Wind / Geomagnetic Activity: The coronal mass ejection that left the sun on 2nd Sept may give Earth a glancing blow on day 1 (5th). No other Earth-directed CMEs expected. Solar winds will initially be strong on day 1 (5th), gradually easing to elevated levels, although there is a slight chance of a brief rejuvenation due to a possible glancing blow from a CME. Solar winds should then fall back to slightly elevated by day 2 (6th) or day 3 (7th). Further periods of G1/Minor to G2/Moderate Geomagnetic Storms are expected on day 1 (5th), with a slight chance of further G3/Strong (Kp7) Storms. Geomagnetic activity should begin to reduce to Active to Unsettled into day 2 (6th), or perhaps day 3 (7th), before reducing to mostly Quiet or Unsettled by day 4 (8th).

Energetic Particles / Solar Radiation: The count rate of energetic particles (high energy protons) is likely to remain below the Minor Radiation Storm level (S1). There remains a slight chance of further increases to or above the S1 level, should any significant flares occur from the large sunspot region on the visible disc.

Space Weather Forecast

Geomagnetic Storms:

Geo-Magnetic Storm Probability (Exceedance)	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Minor or Moderate	G1 to G2	Yes	70	20	10	10
Strong	G3	No	5	1	1	1
Severe	G4	No	1	1	1	1
Extreme	G5	No	1	1	1	1

Radio Blackouts - X Ray Flares:

X Ray Flares Probability	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	R1-R2 M Class	No	40	45	45	45
Very Active	R3 to R5 X	No	5	5	5	5

Solar Radiation Storms - (High Energy Protons):

Radiation Storms Probability (Exceedance)	Level (cm^{-2} sr^{-1} s^{-1})	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	≥ S1	No	3	3	3	3
Very Active	≥ S3 *	No	1	1	1	1
* S3 ≥ 10 MeV ≥ 1000 pfu and / or ≥ 50 MeV ≥ 10 pfu. (pfu = $cm^{-2}sr^{-1}s^{-1}$)
